Literature Number: SNIS109D

# LM76

## $\pm 0.5^{\circ}\text{C}$ , $\pm 1^{\circ}\text{C}$ , 12-Bit + Sign Digital Temperature Sensor and Thermal Window Comparator with Two-Wire Interface

### General Description

The LM76 is a digital temperature sensor and thermal window comparator with an I<sup>2</sup>C™ Serial Bus interface with an accuracy of  $\pm 1^{\circ}\text{C}$ . This accuracy for the LM76CHM is specified for a  $-10^{\circ}\text{C}$  to  $45^{\circ}\text{C}$  temperature range. The LM76CHM is specified with an accuracy  $\pm 0.5^{\circ}\text{C}$  at  $25^{\circ}\text{C}$ . The window-comparator architecture of the LM76 eases the design of temperature control systems conforming to the ACPI (Advanced Configuration and Power Interface) specification for personal computers. The open-drain Interrupt (INT) output becomes active whenever temperature goes outside a programmable window, while a separate Critical Temperature Alarm (T\_CRIT\_A) output becomes active when the temperature exceeds a programmable critical limit. The INT output can operate in either a comparator or event mode, while the T\_CRIT\_A output operates in comparator mode only.

The host can program both the upper and lower limits of the window as well as the critical temperature limit. Programmable hysteresis as well as a fault queue are available to minimize false tripping. Two pins (A0, A1) are available for address selection. The sensor powers up with default thresholds of  $2^{\circ}\text{C}$  T<sub>HYST</sub>,  $10^{\circ}\text{C}$  T<sub>LOW</sub>,  $64^{\circ}\text{C}$  T<sub>HIGH</sub>, and  $80^{\circ}\text{C}$  T<sub>CRIT</sub>.

The LM76's 5.0V supply voltage, Serial Bus interface, 12-bit + sign output, and full-scale range of over  $127^{\circ}\text{C}$  make it ideal for a wide range of applications. These include thermal management and protection applications in personal computers, electronic test equipment, office electronics and bio-medical applications.

### Features

- Window comparison simplifies design of ACPI compatible temperature monitoring and control.
- Serial Bus interface
- Separate open-drain outputs for Interrupt and Critical Temperature shutdown
- Shutdown mode to minimize power consumption
- Up to 4 LM76s can be connected to a single bus
- 12-bit + sign output; full-scale reading of over  $127^{\circ}\text{C}$

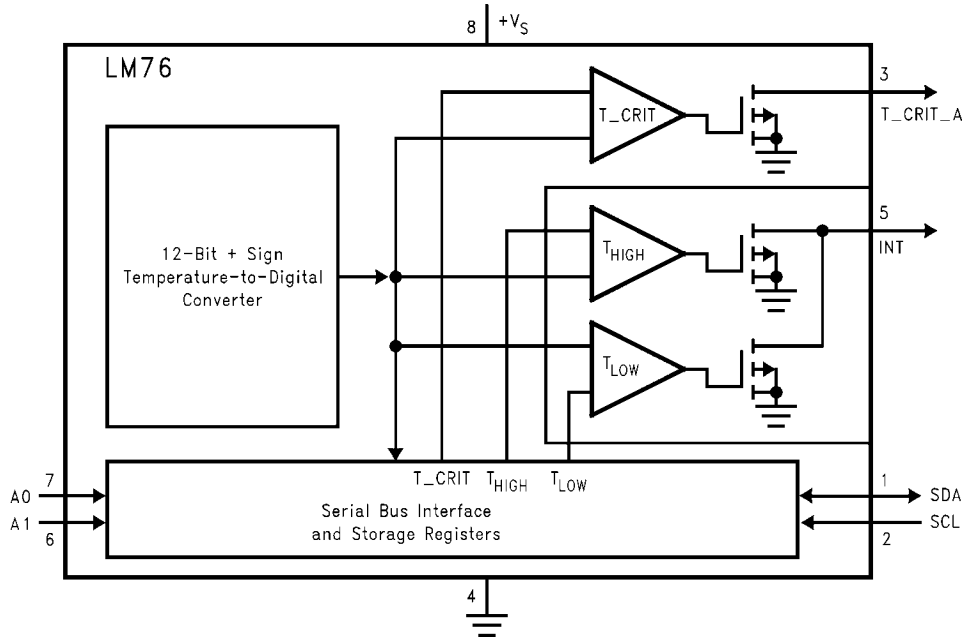

### Key Specifications

■ Supply Voltage		5.0V
■ Supply Current	operating	250 $\mu\text{A}$ (typ)
		450 $\mu\text{A}$ (max)
■ Temperature Accuracy	shutdown	8 $\mu\text{A}$ (max)
	+25°C	$\pm 0.5^{\circ}\text{C}$ (max)
■ Resolution	-10°C to +45°C	$\pm 1.0^{\circ}\text{C}$ (max)
	70°C to 100°C	$\pm 1.0^{\circ}\text{C}$ (max)
■ Resolution		0.0625°C

### Applications

- System Thermal Management
- Personal Computers
- Office Electronics
- HVAC

10101504

**Note 1:** *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its rated operating conditions.

**Note 2:** When the input voltage ( $V_i$ ) at any pin exceeds the power supplies ( $V_i < \text{GND}$  or  $V_i > +V_S$ ) the current at that pin should be limited to 5 mA. The 20 mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 5 mA to four.

**Note 3:** See AN-450 "Surface Mounting Methods and Their Effect on Product Reliability" or the section titled "Surface Mount" found in a current *National Semiconductor Linear Data Book* for other methods of soldering surface mount devices.

**Note 4:** Human body model, 100 pF discharged through a 1.5 k $\Omega$  resistor. Machine model, 200 pF discharged directly into each pin.

**Note 5:** LM76  $\theta_{JA}$  (thermal resistance, junction-to-ambient) when attached to a printed circuit board with 2 oz. foil is 200°C/W.

**Note 6:** While the LM76 has a full-scale-range in excess of 128°C, prolonged operation at temperatures above 125°C is not recommended.

**Note 7:** The LM76 will operate properly over the  $+V_S$  supply voltage range of 3V to 5.5V for the LM76CNM-3 and the LM76CHM-5. The LM76CNM-3 is tested and specified for rated accuracy at the nominal supply voltage of 3.3V. Accuracy of the LM76CNM-3 will degrade 0.2°C for a  $\pm 1\%$  variation in  $+V_S$  from the nominal value. The LM76CHM-5 is tested and specified for a rated accuracy at the nominal supply voltage of 5.0V. Accuracy of the LM76CHM-5 will degrade 0.08°C for a  $\pm 1\%$  variation in  $+V_S$  from the nominal value.

**Note 8:** Typicals are at  $T_A = 25^\circ\text{C}$  and represent most likely parametric norm.

**Note 9:** Limits are guaranteed to National's AOQL (Average Outgoing Quality Level).

**Note 10:** 12 bits + sign, two's complement

**Note 11:** This specification is provided only to indicate how often temperature data is updated. The LM76 can be read at any time without regard to conversion state (and will yield last conversion result). If a conversion is in process it will be interrupted and restarted after the end of the read.

**Note 12:** For best accuracy, minimize output loading. Higher sink currents can affect sensor accuracy with internal heating. This can cause an error of 0.64°C at full rated sink current and saturation voltage based on junction-to-ambient thermal resistance.

**Note 13:** Hysteresis value adds to the  $T_{\text{LOW}}$  setpoint value (e.g.: if  $T_{\text{LOW}}$  setpoint = 10°C, and hysteresis = 2°C, then actual hysteresis point is 10+2 = 12°C); and subtracts from the  $T_{\text{HIGH}}$  and  $T_{\text{CRIT}}$  setpoints (e.g.: if  $T_{\text{HIGH}}$  setpoint = 64°C, and hysteresis = 2°C, then actual hysteresis point is 64-2 = 62°C). For a detailed discussion of the function of hysteresis refer to *Section 1.1, TEMPERATURE COMPARISON*, and *Figure 3*.

**Note 14:** Default values set at power up.

**Note 15:** Timing specifications are tested at the bus input logic levels ( $V_{\text{in}(0)}=0.3xV_A$  for a falling edge and  $V_{\text{in}(1)}=0.7xV_A$  for a rising edge) when the SCL and SDA edge rates are similar.

10101505

**FIGURE 2. Temperature-to-Digital Transfer Function (Non-linear scale for clarity)**

## 1.0 Functional Description

The LM76 temperature sensor incorporates a band-gap type temperature sensor, 13-bit ADC, and a digital comparator with user-programmable upper and lower limit values. The comparator activates either the INT line for temperatures outside the  $T_{LOW}$  and  $T_{HIGH}$  window, or the  $T_{CRIT\_A}$  line for temperatures which exceed  $T_{CRIT}$ . The lines are programmable for mode and polarity.

### 1.1 TEMPERATURE COMPARISON

LM76 provides a window comparison against a lower ( $T_{LOW}$ ) and upper ( $T_{HIGH}$ ) trip point. A second upper trip point ( $T_{CRIT}$ ) functions as a critical alarm shutdown. *Figure 3* depicts the comparison function as well as the modes of operation.

#### 1.1.1 Status Bits

The internal Status bits operate as follows:

**“True”:** Temperature above a  $T_{HIGH}$  or  $T_{CRIT}$  is “true” for those respective bits. A “true” for  $T_{LOW}$  is temperature below  $T_{LOW}$ .

**“False”:** Assuming temperature has previously crossed above  $T_{HIGH}$  or  $T_{CRIT}$ , then the temperature must drop below the points corresponding  $T_{HYST}(T_{HIGH} - T_{HYST}$  or  $T_{CRIT} - T_{HYST})$  in order for the condition to be false. For  $T_{LOW}$ , assuming temperature has previously crossed below  $T_{LOW}$ , a “false” occurs when temperature goes above  $T_{LOW} + T_{HYST}$ .

The Status bits are not affected by reads or any other actions, and always represent the state of temperature vs. setpoints.

#### 1.1.2 Hardwire Outputs

The  $T_{CRIT\_A}$  hardwire output mirrors the  $T_{CRIT\_A}$  flag, when the flag is true, the  $T_{CRIT\_A}$  output is asserted at all times regardless of mode. Reading the LM76 has no effect on the  $T_{CRIT\_A}$  output, although the internal conversion is restarted.

The behavior of the INT hardwire output is as follows:

**Comparator Interrupt Mode (Default):** User reading part resets output until next measurement completes. If condition is still true, output is set again at end of next conversion cycle. For example, if a user never reads the part, and temperature goes below  $T_{LOW}$  then INT becomes active. It would stay that way until temperature goes above  $T_{LOW} + T_{HYST}$ . However if the user reads the part, the output would be reset. At the end of the next conversion cycle, if the condition is true, it is set again. If not, it remains reset.

**Event Interrupt Mode:** User reading part resets output until next condition “event” occurs (in other words, output is only set once for a true condition, if reset by a read, it remains reset until the next triggering threshold has been crossed). Conversely, if a user never read the part, the output would stay set indefinitely after the first event that set the output. An “event” for Event Interrupt Mode is defined as:

1. Transitioning upward across a setpoint, or
2. Transitioning downward across a setpoint’s corresponding hysteresis (after having exceeded that setpoint).

For example, if a user never read the part, and temperature went below  $T_{LOW}$  then INT would become active. It would stay that way forever if a user never read the part.

However if the user read the part, the output would be reset. Even if the condition is true, it will remain reset. The temperature must cross above  $T_{LOW} + T_{HYST}$  to set the output again.

In either mode, reading any register in the LM76 restarts the conversion. This allows a designer to know exactly when the LM76 begins a comparison. This prevents unnecessary Interrupts just after reprogramming setpoints. Typically, system Interrupt inputs are masked prior to reprogramming trip points. By doing a read just after resetting trip points, but prior to unmasking, unexpected Interrupts are prevented.

Avoid programming setpoints so close that their hysteresis values overlap. An example would be that with a  $T_{HYST}$  value of  $2^{\circ}\text{C}$  then setting  $T_{HIGH}$  and  $T_{LOW}$  to within  $4^{\circ}\text{C}$  of each other will violate this restriction. To be more specific, with  $T_{HYST}$  set to  $2^{\circ}\text{C}$  assume  $T_{HIGH}$  set to  $64^{\circ}\text{C}$ . If  $T_{LOW}$  is set equal to, or higher than  $60^{\circ}\text{C}$  this restriction is violated.

### 1.2 DEFAULT SETTINGS

The LM76 always powers up in a known state. LM76 power up default conditions are:

1. Comparator Interrupt Mode
2.  $T_{LOW}$  set to  $10^{\circ}\text{C}$
3.  $T_{HIGH}$  set to  $64^{\circ}\text{C}$
4.  $T_{CRIT}$  set to  $80^{\circ}\text{C}$
5.  $T_{HYST}$  set to  $2^{\circ}\text{C}$
6. INT and  $T_{CRIT\_A}$  active low
7. Pointer set to “00”; Temperature Register

The LM76 registers will always reset to these default values when the power supply voltage is brought up from zero volts as the supply crosses the voltage level plotted in the following curve. The LM76 registers will reset again when the power supply drops below the voltage plotted in this curve.

Average Power on Reset Voltage vs Temperature

10101518

### 1.3 SERIAL BUS INTERFACE

The LM76 operates as a slave on the Serial Bus, so the SCL line is an input (no clock is generated by the LM76) and the SDA line is a bi-directional serial data line. According to Serial Bus specifications, the LM76 has a 7-bit slave address. The five most significant bits of the slave address are hard wired inside the LM76 and are “10010”. The two least significant bits of the address are assigned to pins A1–A0, and are set by connecting these pins to ground for a low, (0); or to  $+V_S$  for a high, (1).

Therefore, the complete slave address is:

1	0	0	1	0	A1	A0
MSB					LSB	

10101506

**Note:** Event Interrupt mode is drawn as if the user is reading the part. If the user doesn't read, the outputs would go low and stay that way until the LM76 is read.

**FIGURE 3. Temperature Response Diagram**

#### 1.4 TEMPERATURE DATA FORMAT

Temperature data can be read from the Temperature and Set Point registers; and written to the Set Point registers. Temperature data can be read at any time, although reading faster than the conversion time of the LM76 will prevent data from being updated. Temperature data is represented by a 13-bit, two's complement word with an LSB (Least Significant Bit) equal to 0.0625°C:

Temperature	Digital Output	
	Binary	Hex
+130°C	0 1000 0 010 0000	08 20h
+125°C	0 0111 1101 0000	07 D0h
+80°C	0 0101 1010 0000	05 90h
+64°C	0 0100 0000 0000	04 00h
+25°C	0 0001 1001 0000	01 90h
+10°C	0 0000 1010 0000	00 A0h
+2°C	0 0000 0010 0000	00 20h
+0.0625°C	0 0000 0000 0001	00 01h
0°C	00 0000 0000	00 00h
-0.0625°C	1 1111 1111 1111	1F FFh
-25°C	1 1110 0111 0000	1E 70h
-55°C	1 1100 1001 0000	1C 90h

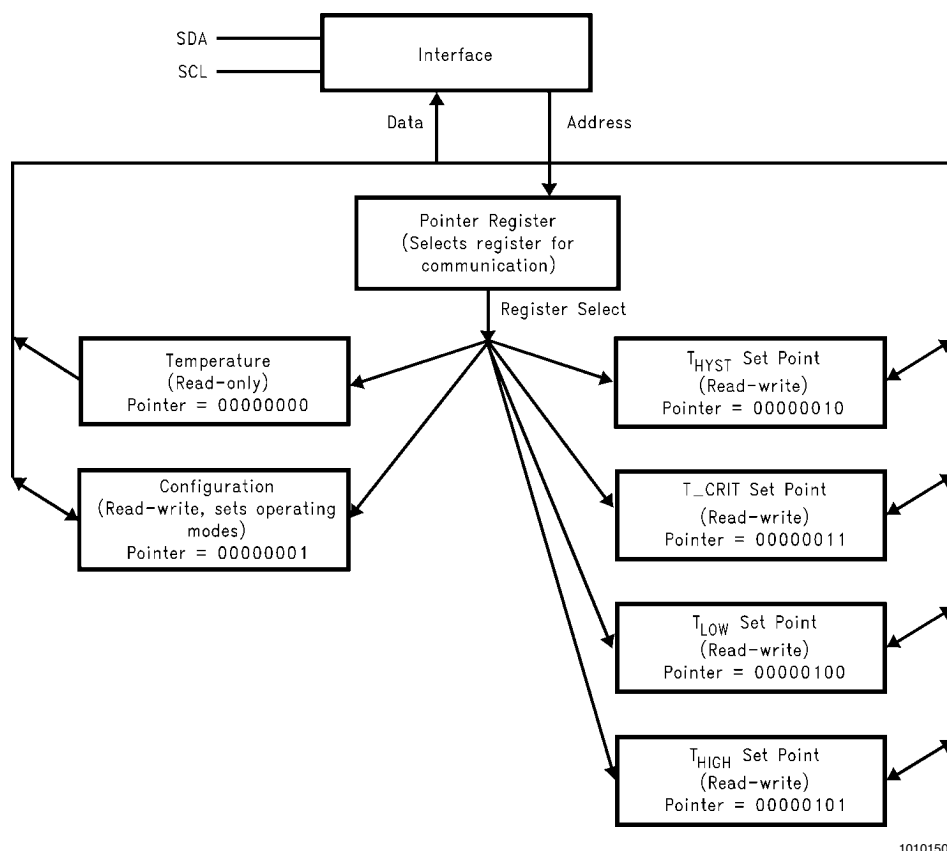

## 1.5 SHUTDOWN MODE

Shutdown mode is enabled by setting the shutdown bit in the Configuration register via the Serial Bus. Shutdown mode reduces power supply current to 5  $\mu$ A typical. T\_CRIT\_A is reset if previously set. Since conversions are stopped during shutdown, T\_CRIT\_A and INT will not be operational. The Serial Bus interface remains active. Activity on the clock and data lines of the Serial Bus may slightly increase shutdown mode quiescent current. Registers can be read from and written to in shutdown mode. The LM76 takes milliseconds to respond to the shutdown command.

## 1.6 INT AND T\_CRIT\_A OUTPUT

The INT and T\_CRIT\_A outputs are open-drain outputs and do not have internal pull-ups. A "high" level will not be ob-

## 1.8 INTERNAL REGISTER STRUCTURE

There are four data registers in the LM76, selected by the Pointer register. At power-up the Pointer is set to "00"; the location for the Temperature Register. The Pointer register latches the last location it was set to. In Interrupt Mode, a read from the LM76 resets the INT output. Placing the device in Shutdown mode resets the INT and T\_CRIT\_A outputs. All registers are read and write, except the Temperature register which is read only.

A write to the LM76 will always include the address byte and the Pointer byte. A write to the Configuration register requires one data byte, while the T<sub>LOW</sub>, T<sub>HIGH</sub>, and T\_CRIT registers require two data bytes.

Reading the LM76 can take place either of two ways: If the location latched in the Pointer is correct (most of the time it is expected that the Pointer will point to the Temperature register because it will be the data most frequently read from the LM76), then the read can simply consist of an address byte,

served on these pins until pull-up current is provided from some external source, typically a pull-up resistor. Choice of resistor value depends on many system factors but, in general, the pull-up resistor should be as large as possible. This will minimize any errors due to internal heating of the LM76. The maximum resistance of the pull up, based on LM76 specification for High Level Output Current, to provide a 2 volt high level, is 30K ohms.

## 1.7 FAULT QUEUE

A fault queue of up to 4 faults is provided to prevent false tripping when the LM76 is used in noisy environments. The 4 faults must occur consecutively to set flags as well as INT and T\_CRIT\_A outputs. The fault queue is enabled by setting bit 4 of the Configuration Register high (see Section 1.11).

followed by retrieving the corresponding number of data bytes. If the Pointer needs to be set, then an address byte, pointer byte, repeat start, and another address byte plus required number of data bytes will accomplish a read.

The first data byte is the most significant byte with most significant bit first, permitting only as much data as necessary to be read to determine the temperature condition. For instance, if the first four bits of the temperature data indicates a critical condition, the host processor could immediately take action to remedy the excessive temperature. At the end of a read, the LM76 can accept either Acknowledge or No Acknowledge from the Master (No Acknowledge is typically used as a signal for the slave that the Master has read its last byte).

An inadvertent 8-bit read from a 16-bit register, with the D7 bit low, can cause the LM76 to stop in a state where the SDA line is held low as shown in [Figure 4](#). This can prevent any further bus communication until at least 9 additional clock cy-

cles have occurred. Alternatively, the master can issue clock cycles until SDA goes high, at which time issuing a "Stop" condition will reset the LM76.

10101508

D0–D2: Undefined

D3–D15: T<sub>HYST</sub>, T<sub>LOW</sub>, T<sub>HIGH</sub> or T<sub>CRIT</sub> Trip Temperature Data. Power up default is T<sub>LOW</sub> = 10°C, T<sub>HIGH</sub> = 64°C, T<sub>CRIT</sub> = 80°C, T<sub>HYST</sub> = 2°C.

T<sub>HYST</sub> is subtracted from T<sub>HIGH</sub> and T<sub>CRIT</sub>, and added to T<sub>LOW</sub>.

Avoid programming setpoints so close that their hysteresis values overlap. See *Section 1.1*.

### 3.0 Application Hints

The temperature response graph in *Figure 7* depicts a typical application designed to meet ACPI requirements. In this type of application, the temperature scale is given an arbitrary value of "granularity", or the window within which temperature notification events should occur. The LM76 can be programmed to the window size chosen by the designer, and will issue interrupts to the processor whenever the window limits have been crossed. The internal flags permit quick determination of whether the temperature is rising or falling.

The T\_CRIT limit would typically use its separate output to activate hardware shutdown circuitry separate from the processor. This is done because it is expected that if temperature has gotten this high that the processor may not be responding. The separate circuitry can then shut down the system, usually by shutting down the power supply.

Note that the INT and T\_CRIT\_A outputs are separate, but can be wire-or'd together. Alternatively the T\_CRIT\_A can be diode or'd to the INT line in such a way that a T\_CRIT\_A event activates the INT line, but an INT event does not activate the T\_CRIT\_A line. This may be useful in the event that it is desirable to notify both the processor and separate T\_CRIT\_A shutdown circuitry of a critical temperature alarm at the same time (maybe the processor is still working and can coordinate a graceful shutdown with the separate shutdown circuit).

To implement ACPI compatible sensing it is necessary to sense whenever the temperature goes outside the window,

issue an interrupt, service the interrupt, and reprogram the window according to the desired granularity of the temperature scale. The reprogrammed window will now have the current temperature inside it, ready to issue an interrupt whenever the temperature deviates from the current window.

To understand this graph, assume that at the left hand side the system is at some nominal temperature. For the 1st event temperature rises above the upper window limit,  $T_{HIGH}$ , causing INT to go active. The system responds to the interrupt by querying the LM76's status bits and determines that  $T_{HIGH}$  was exceeded, indicating that temperature is rising. The system then reprograms the temperature limits to a value higher by an amount equal to the desired granularity. Note that in Event Interrupt Mode, reprogramming the limits has caused a second, known, interrupt to be issued since temperature has been returned within the window. In Comparator Interrupt Mode, the LM76 simply stops issuing interrupts.

The 2nd event is another identical rise in temperature. The 3rd event is typical of a drop in temperature. This is one of the conditions that demonstrates the power of the LM76, as the user receives notification that a lower limit is exceeded in such a way that temperature is dropping.

The Critical Alarm Event activates the separate T\_CRIT\_A output. Typically, this would feed circuitry separate from the processor on the assumption that if the system reached this temperature, the processor might not be responding.

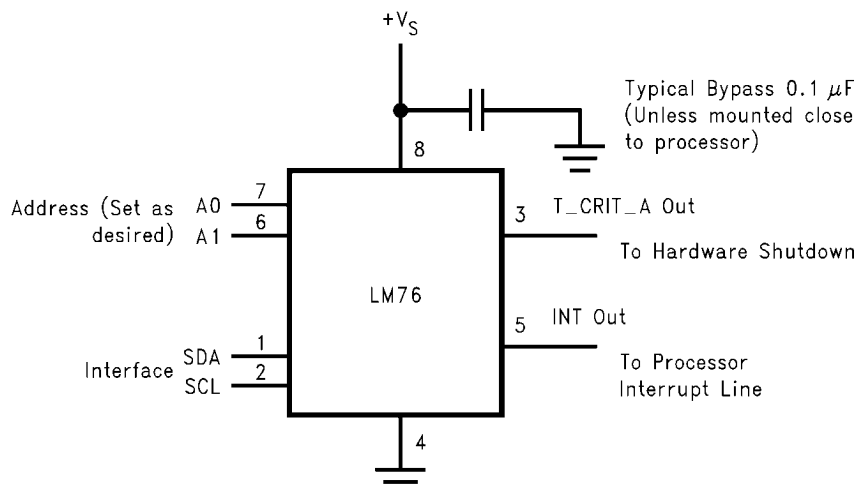

10101515

**Note:** Event Interrupt mode is drawn as if the user is reading the part. If the user doesn't read, the outputs would go low and stay that way until the LM76 is read.

#### LIFE SUPPORT POLICY

**NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION.** As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
