## AMMC-5618 DC Specifications / Physical Properties<sup>[1]</sup>

Symbol	Parameters and Test Conditions	Unit	Min.	Typical	Max.
$V_{D1}, V_{D2}$	Recommended Drain Supply Voltage	V	3	5	7
$I_{D1}$	First stage Drain Supply Current ( $V_{D1} = 5V, V_{G1} = \text{Open or Ground}$ )	mA		48	
$I_{D2}$	Second stage Drain Supply Current ( $V_{D2} = 5V, V_{G2} = \text{Open or Ground}$ )	mA		59	
$I_{D1} + I_{D2}$	Total Drain Supply Current ( $V_{G1} = V_{G2} = \text{Open or Ground}, V_{D1} = V_{D2} = 5V$ )	mA		107	140
$\theta_{ch-b}$	Thermal Resistance <sup>[2]</sup> (Backside temperature ( $T_b$ ) = 25°C)	°C/W		22	

### Notes:

1. Backside temperature  $T_b = 25^\circ\text{C}$  unless otherwise noted
2. Channel-to-backside Thermal Resistance ( $\theta_{ch-b}$ ) = 32°C/W at  $T_{channel} (T_c) = 150^\circ\text{C}$  as measured using infrared microscopy.  
Thermal Resistance at backside temperature ( $T_b$ ) = 25°C calculated from measured data.

## AMMC-5618 RF Specifications<sup>[3,5]</sup>

( $T_b = 25^\circ\text{C}, V_{DD} = 5V, I_{DD} = 107\text{ mA}, Z_0 = 50\ \Omega$ )

Symbol	Parameters and Test Conditions	Unit	Min.	Typical	Max.
$ S_{21} ^2$	Small-signal Gain	dB	12.5	14.5	
$\Delta S_{21} ^2$	Small-signal Gain Flatness	dB		± 0.3	
$RL_{in}$	Input Return Loss	dB	9	12	
$RL_{out}$	Output Return Loss	dB	9	12	
$ S_{12} ^2$	Isolation	dB	40	45	
$P_{-1dB}$	Output Power at 1dB Gain Compression @ 20 GHz	dBm	17.5	19.5	
$P_{sat}$	Saturated Output Power (3dB Gain Compression) @ 20 GHz	dBm		20.5	
OIP3	Output 3rd Order Intercept Point @ 20 GHz	dBm		26	
$\Delta S_{21} / \Delta T$	Temperature Coefficient of Gain <sup>[4]</sup>	dB/°C		-0.023	
NF	Noise Figure @ 20 GHz	dB		4.4	6.5

### Notes:

3. 100% on-wafer RF test is done at frequency = 6, 13 and 20 GHz, except as noted.
4. Temperature Coefficient of Gain based on sample test
5. All tested parameters guaranteed with measurement accuracy ±1.5dB for S12, ±1dB for S11, S21, S22, P1dB and ±0.5dB for NF.

## Biasing and Operation

The AMMC-5618 is normally biased with a single positive drain supply connected to both  $V_{D1}$  and  $V_{D2}$  bond pads as shown in Figure 19(a). The recommended supply voltage is 3 to 5 V.

No ground wires are required because all ground connections are made with plated through-holes to the backside of the device.

Gate bias pads ( $V_{G1}$  &  $V_{G2}$ ) are also provided to allow adjustments in gain, RF output power, and DC power dissipation, if necessary. No connection to the gate pad is needed for single drain-bias operation. However, for custom applications, the DC current flowing through the input and/or output gain stage may be adjusted by applying a voltage to the gate bias pad(s) as shown in Figure 19(b). A negative gate-pad voltage will decrease the drain current. The gate-pad voltage is approximately zero volt during operation with no DC gate supply. Refer to the Absolute Maximum Ratings table for allowed DC and thermal conditions.

## Assembly Techniques

The backside of the AMMC-5618 chip is RF ground. For microstripline applications, the chip should be attached directly to the ground plane (e.g., circuit carrier or heat-sink) using electrically conductive epoxy <sup>[1,2]</sup>.

For best performance, the topside of the MMIC should be brought up to the same height as the circuit surrounding it. This can be accomplished by mounting a gold plated metal shim (same length and width as the MMIC) under the chip, which is of the correct thickness to make the chip and adjacent circuit coplanar.

The amount of epoxy used for chip and or shim attachment should be just enough to provide a thin fillet around the bottom perimeter of the chip or shim. The ground plane should be free of any residue that may jeopardize electrical or mechanical attachment.

The location of the RF bond pads is shown in Figure 20. Note that all the RF input and output ports are in a Ground-Signal-Ground configuration.

RF connections should be kept as short as reasonable to minimize performance degradation due to undesirable series inductance. A single bond wire is sufficient for signal connections, however double-bonding with 0.7 mil gold wire or the use of gold mesh is recommended for best performance, especially near the high end of the frequency range.

Thermosonic wedge bonding is the preferred method for wire attachment to the bond pads. Gold mesh can be attached using a 2 mil round tracking tool and a tool force of approximately 22 grams with an ultrasonic power of roughly 55dB for a duration of  $76 \pm 8$  mS. A guided wedge at an ultrasonic power level of 64 dB can be used for the 0.7 mil wire. The recommended wire bond stage temperature is  $150 \pm 2^\circ$  C.

Caution should be taken to not exceed the Absolute Maximum Rating for assembly temperature and time.

The chip is 100  $\mu$ m thick and should be handled with care. This MMIC has exposed air bridges on the top surface and should be handled by the edges or with a custom collet (do not pick up die with vacuum on die center.)

This MMIC is also static sensitive and ESD handling precautions should be taken.

### Notes:

1. Ablebond 84-1 LM1 silver epoxy is recommended.
2. Eutectic attach is not recommended and may jeopardize reliability of the device.
