TEXAS INSTRUMENTS

**TL2575, TL2575HV**

SLVS638C – JANUARY 2006 – REVISED NOVEMBER 2014

# TL2575, TL2575HV 1-A Simple Step-Down Switching Voltage Regulators

## 1 Features

- Fixed 3.3-V, 5-V, 12-V, and 15-V Options with ±5% Regulation (Max) Over Line, Load, and Temperature Conditions
- Adjustable Option With a Range of 1.23 V to 37 V (57 V for HV Version) and ±4% Regulation (Max) Over Line, Load, and Temperature Conditions
- Specified 1-A Output Current
- Wide Input Voltage Range
    - 4.75 V to 40 V (60 V for HV Version)
- Requires Only Four External Components (Fixed Versions) and Uses Readily Available Standard Inductors
- 52-kHz (Typ) Fixed-Frequency Internal Oscillator
- TTL Shutdown Capability With 50-µA (Typ) Standby Current
- High Efficiency
    - As High as 88% (Typ)
- Thermal Shutdown and Current-Limit Protection with Cycle-by-Cycle Current Limiting

## 2 Applications

- Simple High-Efficiency Step-Down (Buck) Regulators
- Pre-Regulators for Linear Regulators
- On-Card Switching Regulators
- Positive-to-Negative Converters (Buck-Boost)
## 3 Description

The TL2575 and TL2575HV devices provide all the active functions needed for a step-down (buck) switching regulator in an integrated circuit. They require four to six external components for operation. They accept a wide input-voltage range of up to 60 V (TL2575-HV) and are available in fixed output voltages of 3.3 V, 5 V, 12 V, 15 V, or an adjustable-output version. The TL2575 and TL2575HV devices have an integrated switch capable of delivering 1 A of load current, with excellent line and load regulation. The device also offers internal frequency compensation, a fixed-frequency oscillator, cycle-by-cycle current limiting, and thermal shutdown. In addition, a manual shutdown is available via an external ON/OFF pin.

### Device Information[1]

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|---|---|---|
| TL2575, TL2575HV | PDIP (16) | 19.31 mm x 6.35 mm |
| | TO-263 (5) | 10.16 mm x 8.93 mm |
| | TO-220 (5) | 10.16 mm x 8.82 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Functional Block Diagram

3.3 V: R2 = 1.7 kΩ
5 V: R2 = 3.1 kΩ
12 V: R2 = 8.84 kΩ
15 V: R2 = 11.3 kΩ
ADJ: R1 = Open, R2 = 0 Ω

Pin numbers are for the KTT (TO-263) package.

# 7 Specifications

## 7.1 Absolute Maximum Ratings[1]

over operating free-air temperature range (unless otherwise noted)

| | | | MIN | MAX | UNIT |
|---|---|---|---|---|---|
| $V_{IN}$ | Supply voltage | TL2575HV | | 60 | V |
| | | TL2575 | | 42 | |
| | $\overline{ON}$/OFF input voltage range | | −0.3 | $V_{IN}$ | V |
| | Output voltage to GND (steady state) | | | −1 | V |
| $T_J$ | Maximum junction temperature | | | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## 7.2 Handling Ratings

| | | | MIN | MAX | UNIT |
|---|---|---|---|---|---|
| $T_{stg}$ | Storage temperature range | | −65 | 150 | °C |
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1] | 0 | 2000 | V |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins[2] | 0 | 1000 | |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | | MIN | MAX | UNIT |
|---|---|---|---|---|---|
| $V_{IN}$ | Supply voltage | TL2575HV | 4.75 | 60 | V |
| | | TL2575 | 4.75 | 40 | |
| $T_J$ | Operating virtual junction temperature | | −40 | 125 | °C |

## 7.4 Thermal Information

| THERMAL METRIC[1] | | KTT | KV | N | UNIT |
|---|---|---|---|---|---|
| | | 5 PINS | 5 PINS | 16 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 26.5 | 26.5 | 67 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 31.8 | 31.8 | 57 | |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | 0.38 | 0.38 | — | |

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report (SPRA953).

## 7.5 Electrical Characteristics — TL2575

$I_{LOAD}$ = 200 mA, $V_{IN}$ = 12 V for 3.3-V, 5-V, and adjustable versions, $V_{IN}$ = 25 V for 12-V version, $V_{IN}$ = 30 V for 15-V version (unless otherwise noted) (see Figure 11)

| PARAMETER | | TEST CONDITIONS | $T_J$ | TL2575 | | | UNIT |
|---|---|---|---|---|---|---|---|
| | | | | MIN | TYP | MAX | |
| $V_{OUT}$ Output voltage | TL2575-33 | $V_{IN}$ = 12 V, $I_{LOAD}$ = 0.2 A | 25°C | 3.234 | 3.3 | 3.366 | V |

| $I_{IB}$ Feedback bias current | | $V_{OUT}$ = 5 V (ADJ version only) | 25°C | | 50 | 100 | nA |
| | | | Full range | | | 500 | |
| $f_o$ Oscillator frequency[1] | | | 25°C | 47 | 52 | 58 | kHz |
| | | | Full range | 42 | | 63 | |
| $V_{SAT}$ Saturation voltage | | $I_{OUT}$ = 1 A[2] | 25°C | | 0.9 | 1.2 | V |
| | | | Full range | | | 1.4 | |
| Maximum duty cycle[3] | | | 25°C | 93% | 98% | | |
| $I_{CL}$ Switch peak current[1][2] | | | 25°C | 1.7 | 2.8 | 3.6 | A |
| | | | Full range | 1.3 | | 4 | |
| $I_L$ Output leakage current | | $V_{IN}$ = 40[4], Output = 0 V | 25°C | | | 2 | mA |
| | | $V_{IN}$ = 40[4], Output = −1 V | | | 7.5 | 30 | |
| $I_Q$ Quiescent current[4] | | | 25°C | | 5 | 10 | mA |
| $I_{STBY}$ Standby quiescent current | | OFF ($\overline{ON}$/OFF = 5 V) | 25°C | | 50 | 200 | µA |

(1) In the event of an output short or an overload condition, self-protection features lower the oscillator frequency to ≈18 kHz and the minimum duty cycle from 5% to ≈2%. The resulting output voltage drops to ≈40% of its nominal value, causing the average power dissipated by the IC to lower.
(2) Output is not connected to diode, inductor, or capacitor. Output is sourcing current.
(3) FEEDBACK is disconnected from output and connected to 0 V.
(4) To force the output transistor off, FEEDBACK is disconnected from output and connected to 12 V for the adjustable, 3.3-V, and 5-V versions and to 25 V for the 12-V and 15-V versions.

## Electrical Characteristics — TL2575 (continued)

$I_{LOAD}$ = 200 mA, $V_{IN}$ = 12 V for 3.3-V, 5-V, and adjustable versions, $V_{IN}$ = 25 V for 12-V version, $V_{IN}$ = 30 V for 15-V version (unless otherwise noted) (see Figure 11)

| PARAMETER | | TEST CONDITIONS | $T_J$ | TL2575 | | | UNIT |
|---|---|---|---|---|---|---|---|

## 8.1 Test Circuits

**Fixed-Output Voltage**

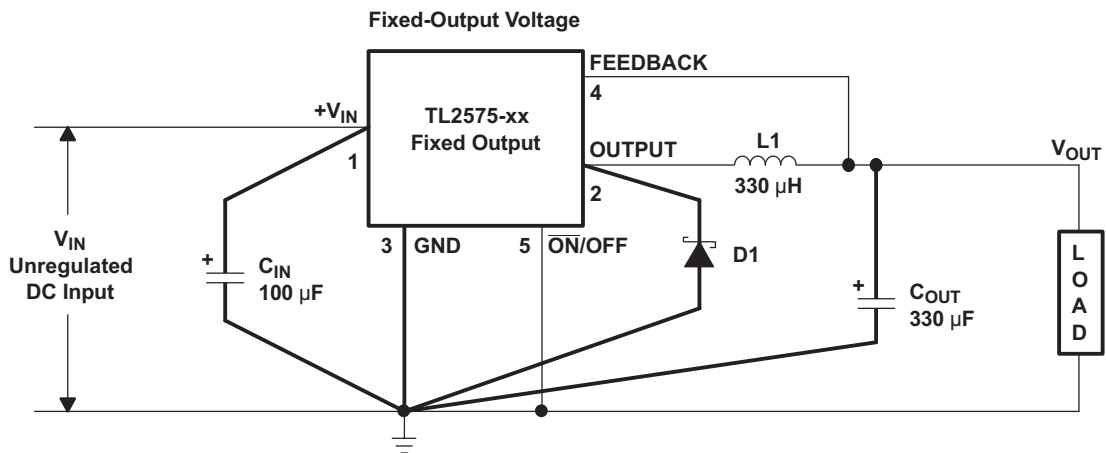

$C_{IN}$ = 100 µF, Aluminum Electrolytic
$C_{OUT}$ = 330 µF, Aluminum Electrolytic
D1 = Schottky
L1 = 330 µH (for 5-V $V_{IN}$ with 3.3-V $V_{OUT}$, use 100 µH)

**Adjustable-Output Voltage**

$V_{OUT} = V_{REF} (1 + R2 / R1) = 5 V$

$V_{REF}$ = 1.23 V
R1 = 2 kΩ
R2 = 6.12 kΩ

Pin numbers are for the KTT (TO-263) package.

**Figure 11. Test Circuits and Layout Guidelines**

# 9 Detailed Description

## 9.1 Overview

The TL2575 and TL2575HV devices greatly simplify the design of switching power supplies by conveniently providing all the active functions needed for a step-down (buck) switching regulator in an integrated circuit. Accepting a wide input-voltage range of up to 60 V (TL2575-HV) and available in fixed output voltages of 3.3 V, 5 V, 12 V, 15 V, or an adjustable-output version, the TL2575 and TL2575HV devices have an integrated switch capable of delivering 1 A of load current, with excellent line and load regulation. The device also offers internal frequency compensation, a fixed-frequency oscillator, cycle-by-cycle current limiting, and thermal shutdown. In addition, a manual shutdown is available via an external ON/OFF pin.

The TL2575 and TL2575HV devices represent superior alternatives to popular three-terminal linear regulators. Due to their high efficiency, the devices significantly reduce the size of the heatsink and, in many cases, no heatsink is required. Optimized for use with standard series of inductors available from several different manufacturers, the TL2575 and TL2575HV greatly simplify the design of switch-mode power supplies by requiring a minimal addition of only four to six external components for operation.

The TL2575 and TL2575HV devices are characterized for operation over the virtual junction temperature range of –40°C to 125°C.

## 9.2 Functional Block Diagram

**3.3 V: R2 = 1.7 kΩ**
**5 V: R2 = 3.1 kΩ**
**12 V: R2 = 8.84 kΩ**
**15 V: R2 = 11.3 kΩ**
**ADJ: R1 = Open, R2 = 0 Ω**

Pin numbers are for the KTT (TO-263) package.

## 9.3 Feature Description

### 9.3.1 Feedback Connection

For fixed-voltage options, FEEDBACK must be wired to $V_{OUT}$. For the adjustable version, FEEDBACK must be connected between the two programming resistors. Again, both of these resistors should be in close proximity to the regulator, and each should be less than 100 kΩ to minimize noise pickup.

### 9.3.2 $\overline{ON}$/OFF Input

$\overline{ON}$/OFF should be grounded or be a low-level TTL voltage (typically < 1.6 V) for normal operation. To shut down the TL2575 or TL2575HV devices and place in standby mode, a high-level TTL or CMOS voltage should be supplied to this pin. $\overline{ON}$/OFF should not be left open and safely can be pulled up to $V_{IN}$ with or without a pullup resistor.

## 9.4 Device Functional Modes

### 9.4.1 Standby Mode

When a high-level TTL or CMOS voltage is applied to the $\overline{ON}$/OFF pin, the device enters standby mode, drawing a typical quiescent current of 50 µA.

# 10 Application and Implementation

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 10.1 Typical Application

Pin numbers are for the KTT (TO-263) package.

**Figure 12. Typical Application Circuit (Fixed Version)**

### 10.1.1 Design Requirements

- Input capacitor for stability
- Output capacitor for loop stability and ripple filtering
- Catch diode to filter noise
- Output inductor depending on the mode of operation

### 10.1.2 Detailed Design Procedure

#### 10.1.2.1 Input Capacitor (C_IN)

For stability concerns, an input bypass capacitor (electrolytic, $C_{IN} \geq 47$ µF) needs to be located as close as possible to the regulator. For operating temperatures below –25°C, $C_{IN}$ may need to be larger in value. In addition, since most electrolytic capacitors have decreasing capacitances and increasing ESR as temperature drops, adding a ceramic or solid tantalum capacitor in parallel increases the stability in cold temperatures.

To extend the capacitor operating lifetime, the capacitor RMS ripple current rating should be calculated as shown in Equation 1.

$$I_{C,RMS} > 1.2 \, (t_{on} / T) \, I_{LOAD}$$

where

- $t_{on}/T = V_{OUT}/V_{IN}$ {buck regulator}
- $t_{on}/T = |V_{OUT}|/(|V_{OUT}| + V_{IN})$ {buck-boost regulator}                    (1)

#### 10.1.2.2 Output Capacitor (C_OUT)

For both loop stability and filtering of ripple voltage, an output capacitor is required, again in close proximity to the regulator. For best performance, low-ESR aluminum electrolytics are recommended, although standard aluminum electrolytics may be adequate for some applications as shown in Equation 2.

Output ripple voltage = (ESR of $C_{OUT}$) × (inductor ripple current)                    (2)

Product Folder Links: *TL2575  TL2575HV*

## Typical Application (continued)

Output ripple of 50 mV to 150 mV typically can be achieved with capacitor values of 220 µF to 680 µF. Larger $C_{OUT}$ can reduce the ripple 20 mV to 50 mV peak to peak. To improve further on output ripple, paralleling of standard electrolytic capacitors may be used. Alternatively, higher-grade capacitors such as high frequency, low inductance, or low ESR can be used.

The following should be taken into account when selecting $C_{OUT}$:

* At cold temperatures, the ESR of the electrolytic capacitors can rise dramatically (typically 3× nominal value at −25°C). Because solid-tantalum capacitors have significantly better ESR specifications at cold temperatures, they should be used at operating temperature lower than −25°C. As an alternative, tantalums can also be paralleled to aluminum electrolytics and should contribute 10% to 20% to the total capacitance.
* Low ESR for $C_{OUT}$ is desirable for low output ripple. However, the ESR should be greater than 0.05 Ω to avoid the possibility of regulator instability. Hence, a sole tantalum capacitor used for $C_{OUT}$ is most susceptible to this occurrence.
* The ripple current rating of the capacitor, 52 kHz, should be at least 50% higher than the peak-to-peak inductor ripple current.

### 10.1.2.3 Catch Diode

As with other external components, the catch diode should be placed close to the output to minimize unwanted noise. Schottky diodes have fast switching speeds and low forward voltage drops and, thus, offer the best performance, especially for switching regulators with low output voltages ($V_{OUT}$ < 5 V). If a high-efficiency, fast-recovery, or ultra-fast-recovery diode is used in place of a Schottky, it should have a soft recovery (versus abrupt turn-off characteristics) to avoid the chance of causing instability and EMI. Standard 50- to 60-Hz diodes, such as the 1N4001 or 1N5400 series, are not suitable.

### 10.1.2.4 Inductor

Proper inductor selection is key to the performance-switching power-supply designs. One important factor to consider is whether the regulator is used in continuous mode (inductor current flows continuously and never drops to zero) or in discontinuous mode (inductor current goes to zero during the normal switching cycle). Each mode has distinctively different operating characteristics and, therefore, can affect the regulator performance and requirements. In many applications, the continuous mode is the preferred mode of operation, since it offers greater output power with lower peak currents, and also can result in lower output ripple voltage. The advantages of continuous mode of operation come at the expense of a larger inductor required to keep inductor current continuous, especially at low output currents and/or high input voltages.

The TL2575 and TL2575HV devices can operate in either continuous or discontinuous mode. With heavy load currents, the inductor current flows continuously and the regulator operates in continuous mode. Under light load, the inductor fully discharges and the regulator is forced into the discontinuous mode of operation. For light loads (approximately 200 mA or less), this discontinuous mode of operation is perfectly acceptable and may be desirable solely to keep the inductor value and size small. Any buck regulator eventually operates in discontinuous mode when the load current is light enough.

The type of inductor chosen can have advantages and disadvantages. If high performance or high quality is a concern, then more-expensive toroid core inductors are the best choice, as the magnetic flux is contained completely within the core, resulting in less EMI and noise in nearby sensitive circuits. Inexpensive bobbin core inductors, however, generate more EMI as the open core does not confine the flux within the core. Multiple switching regulators located in proximity to each other are particularly susceptible to mutual coupling of magnetic fluxes from each other's open cores. In these situations, closed magnetic structures (such as a toroid, pot core, or E-core) are more appropriate.

Regardless of the type and value of inductor used, the inductor never should carry more than its rated current. Doing so may cause the inductor to saturate, in which case the inductance quickly drops, and the inductor looks like a low-value resistor (from the dc resistance of the windings). As a result, switching current rises dramatically (until limited by the current-by-current limiting feature of the TL2575 and TL2575HV devices) and can result in overheating of the inductor and the IC itself.

> **NOTE**
> Different types of inductors have different saturation characteristics.

## Typical Application  (continued)

### 10.1.2.5  Output Voltage Ripple and Transients

As with any switching power supply, the output of the TL2575 and TL2575HV devices have a sawtooth ripple voltage at the switching frequency. Typically about 1% of the output voltage, this ripple is due mainly to the inductor sawtooth ripple current and the ESR of the output capacitor (see Output Capacitor ($C_{OUT}$)). Furthermore, the output also may contain small voltage spikes at the peaks of the sawtooth waveform. This is due to the fast switching of the output switch and the parasitic inductance of $C_{OUT}$. These voltage spikes can be minimized through the use of low-inductance capacitors.

There are several ways to reduce the output ripple voltage: a larger inductor, a larger $C_{OUT}$, or both. Another method is to use a small LC filter (20 µH and 100 µF) at the output. This filter can reduce the output ripple voltage by a factor of 10 (see Figure 11).

### 10.1.2.6  Grounding

The power and ground connections of the TL2575 and TL2575HV devices must be low impedance to help maintain output stability. For the 5-pin packages, both pin 3 and tab are ground, and either connection can be used as they are both part of the same lead frame. With the 16-pin package, all the ground pins (including signal and power grounds) should be soldered directly to wide PCB copper traces to ensure low-inductance connections and good thermal dissipation.

### 10.1.2.7  Reverse Current Considerations

There is an internal diode from the output to VIN. Therefore, the device does not protect against reverse current and care must be taken to limit current in this scenario.

### 10.1.2.8  Buck Regulator Design Procedure

| PROCEDURE (Fixed Output) | EXAMPLE (Fixed Output) |
|---|---|
| **Known:**<br>$V_{OUT}$ = 3.3 V, 5 V, 12 V, or 15 V<br>$V_{IN(Max)}$ = Maximum input voltage<br>$I_{LOAD(Max)}$ = Maximum load current | **Known:**<br>$V_{OUT}$ = 5 V<br>$V_{IN(Max)}$ = 20 V<br>$I_{LOAD(Max)}$ = 1 A |
| **1. Inductor Selection (L1)**<br><br>**A.** From Figure 13 through Figure 16, select the appropriate inductor code based on the intersection of $V_{IN(Max)}$ and $I_{LOAD(Max)}$.<br><br>**B.** The inductor chosen should be rated for operation at 52-kHz and have a current rating of at least 1.15 × $I_{LOAD(Max)}$ to allow for the ripple current. The actual peak current in L1 (in normal operation) can be calculated as follows:<br><br>$I_{L1(pk)} = I_{LOAD(Max)} + (V_{IN} - V_{OUT}) \times t_{on} / 2L1$<br>Where $t_{on} = V_{OUT} / V_{IN} \times (1 / f_{osc})$ | **1. Inductor Selection (L1)**<br><br>**A.** From Figure 14 (TL2575-05), the intersection of 20-V line and 1-A line gives an inductor code of L330.<br><br>**B.** L330 → L1 = 330 µH<br>Choose from:<br>    34042 (Schott)<br>    PE-52627 (Pulse Engineering)<br>    RL1952 (Renco) |
| **2. Output Capacitor Selection ($C_{OUT}$)**<br><br>**A.** The TL2575 control loop has a two-pole two-zero frequency response. The dominant pole-zero pair is established by $C_{OUT}$ and L1. To meet stability requirements while maintaining an acceptable output ripple voltage ($V_{ripple} \neq 0.01 \times V_{OUT}$), the recommended range for a standard aluminum electrolytic $C_{OUT}$ is between 100 µF and 470 µF.<br><br>**B.** $C_{OUT}$ should have a voltage rating of at least 1.5 × $V_{OUT}$. But if a low output ripple voltage is desired, choose capacitors with a higher-voltage ratings than the minimum required, due to their typically lower ESRs. | **2. Output Capacitor Selection ($C_{OUT}$)**<br><br>**A.** $C_{OUT}$ = 100-µF to 470-µF, standard aluminum electrolytic<br><br><br><br><br><br>**B.** Although a $C_{OUT}$ rated at 8 V is sufficient for $V_{OUT}$ = 5 V, a higher-voltage capacitor is chosen for its typically lower ESR (and hence lower output ripple voltage) → Capacitor voltage rating = 20 V. |

## 11 Power Supply Recommendations

This device operates with a power supply range of 4.75 V to 40 V (60 V for the TL2575-HV). A 100-µF decoupling capacitor is recommended on the input to filter noise.

## 12 Layout

### 12.1 Layout Guidelines

With any switching regulator, circuit layout plays an important role in circuit performance. Wiring and parasitic inductances, as well as stray capacitances, are subjected to rapidly switching currents, which can result in unwanted voltage transients. To minimize inductance and ground loops, the length of the leads indicated by heavy lines should be minimized. Optimal results can be achieved by single-point grounding (see Figure 11) or by ground-plane construction. For the same reasons, the two programming resistors used in the adjustable version should be located as close as possible to the regulator to keep the sensitive feedback wiring short.

**(1)** The marketing status values are defined as follows:
**ACTIVE:** Product device recommended for new designs.
**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.
**OBSOLETE:** TI has discontinued the production of the device.

**(2)** Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
**TBD:** The Pb-Free/Green conversion plan has not been defined.
**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

**(3)** MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**(4)** There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

**(5)** Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

**(6)** Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF TL2575HV-05, TL2575HV-33 :**

• Automotive: TL2575HV-05-Q1, TL2575HV-33-Q1

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

NOTES:   A.  All linear dimensions are in millimeters.
         B.  This drawing is subject to change without notice.
         C.  Publication IPC−SM−782 is recommended for alternate designs.
         D.  Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release.
             Customers should contact their board assembly site for stencil design recommendations.  Refer to IPC−7525.
         E.  Customers should contact their board fabrication site for solder mask tolerances between and around
             signal pads.
         F.  This package is designed to be soldered to a thermal pad on the board.  Refer to the Product Datasheet
             for specific thermal information, via requirements, and recommended thermal pad size.  For thermal pad
             sizes larger than shown a solder mask defined pad is recommended in order to maintain the solderable
             pad geometry while increasing copper area.

## KV (R−PZFM−T5)    PLASTIC FLANGE−MOUNT PACKAGE

4040209/E   06/2006
NOTES:   A.   All linear dimensions are in inches (millimeters).
B.   This drawing is subject to change without notice.
C.   All lead dimensions apply before solder dip.
D.   The center lead is in electrical contact with the mounting tab.
E.   The chamfer is optional.
F.   Thermal pad contour optional within these dimensions.

# IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
